

BRIDGE MONITORS THAT MIX AND MATCH FOR SUPERYACHT REFITS

Aadaptiv Technologies' latest range of bridge monitors for superyachts are technically perfectly suited to the superyacht refit market, both on compatibility and price. With their modular approach, as little or as much can be upgraded at refit stage, from a complete bridge full beam console through to smaller individual sections. This 'mix and match' approach has led Aadaptiv to many refit yards in recent months to consult and supply to some major superyacht refit projects.

LED touch sensitive controls facilitate ease of operation for all the key functions, which can also be operated independently with an infrared remote control. The bottom entry connections are compatible with modern systems on the

market, as well as being fully able to interface with original low scan legacy CRY based systems which may need to be retained on board. This feature allows any refit project manager to ensure that all the systems can work seamlessly together through the Aadaptiv bridge monitors, whatever their age.

The monitors are available in four different sizes to provide the best widescreen scale formatting and in a combination of daylight or sunlight displays, as well as waterproof.

Aadaptiv is supported with a full service and back up support network in Europe, United States and Australasia. The monitors are 'Designed to Comply' to maritime regulations surrounding recreational and commercial vessels and type approval program is underway.
